

## Accumulator/Out-of-Pocket Calculator: Allows Members to View the Estimated Out-of-Pocket Costs for the Selected Procedures

- When a member searches for a procedure and then selects a facility, Bluebook's platform displays the average price for the procedure at the selected facility.
- Bluebook pulls in the member's accumulator information (deductible spend/remaining and out-of-pocket max spend/remaining to date) to show the member's estimated out-of-pocket cost for the selected procedure at the selected facility.

Provided are sample screenshots of the accumulator/out-of-pocket calculator in action.

The screenshot displays the Healthcare Bluebook interface for the 'Total Knee Replacement' procedure. It shows the average price range (\$21,168 to \$144,092) and the selected facility, Mayo Clinic Hospital, with a quality score of 128 out of 3284. The interface also lists two doctors, Kurt Blasser, MD and Mark Brodersen, MD, both at Mayo Clinic Hospital. A table at the bottom details the member's out-of-pocket costs, including the average price for the procedure and the estimated out-of-pocket cost for the selected procedure.
